Associating a Fileset Revision

What

When you attempt to associate a fileset that has revisions, you'll notice a slightly different workflow, where you are asked to select a revision to associate. (Associating a fileset that has no revisions functions as it always has)

When/Why

Assume our same Firefox fileset, containing two revisions for v79 and v80. When we create a new association for this fileset, we need to tell the system which revision (v79 or v80) that we want to use.

How

Selecting the revision we want to do is very simple, since the FileWave admin just asks us which one we want to use as you'll see below:

You may ask yourself, "What is the 'default' option I see in that menu?" That is a great question and we'll talk about that super-helpful option in another article you'll find linked below.
