

Conflict Type	
Conflicting Installation Type	<p>Note that you have to choose which installation type you want to have before you can preview</p>
	<p>And the preview shows you which association changed, and how it changed</p>
Mixing targets and/or payloads	<p>Notice though that in preview, we see the “added” payloads to the corresponding groups.</p>
Differences in Timing	

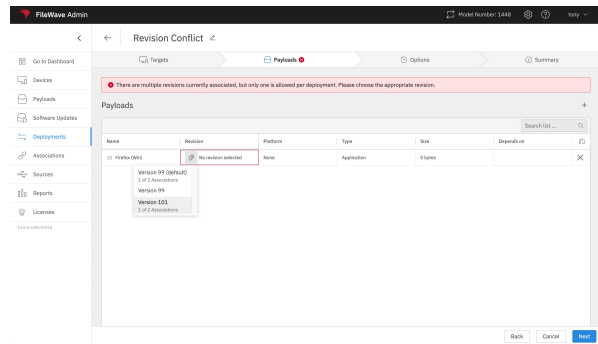

When timing options differ in a new deployment, we zero everything out. If adding to an existing deployment, the original deployment settings win.

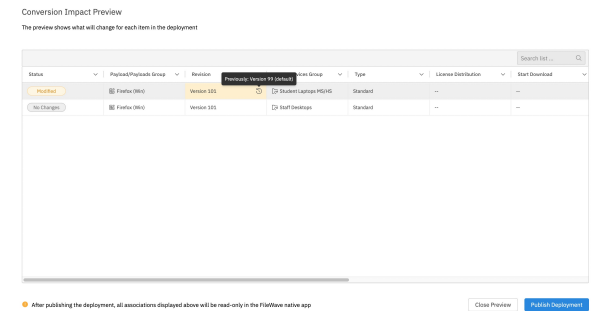

Note that timing option changes will show in preview too.

Differing Payload (Fileset) Revisions

A single deployment can only have one revision of a payload/fileset. In the case of a conflict between revisions, you MUST choose only one.

In preview then, you will see the changed revision.

Digging Deeper

Important note: If there are timing options in the past with regard to file deletion, those “associations” will automatically become exclusions in the new deployment. You’ll see exclusions identified as an icon with a slash through it.

Some additional notes regarding the preview view:

- You can have a lot of records in this view depending on the scope of changes, you can scroll through to review
- NO changes are made until PUBLISH is chosen from the preview page
 - You can cancel a conversion at any point before choosing “Publish” and no changes will be made whatsoever
- There can be 4 types of changes:
 - No change at all
 - Modification of one element (i.e. timing)
 - Addition of an element (i.e. a payload is going to something it wasn’t going to before)
 - Deletion of an element (i.e. a payload is no longer going to something that it did prior)

⌕Revision #2
