

# Imaging Association Deletion, Enable and Disable

## What

Previously created image associations can have three actions taken on them, depending on their current state. They can be deleted, enabled or disabled.

## When/Why

Deletion is always the same...it removes the association between an image and a device. We'll use this when we no longer want the association (it removes the potential for accidental imaging). Enable/Disable toggles the association between being enabled or disabled. This toggle is used primarily to avoid re-imaging a device that was just imaged and is toggled automatically by the IVS during imaging. It can be changed manually as well though...usually for re-enabling.

## How

With one or more devices selected in the view, you can delete, or enable/disable from the bottom bar prompt:
