

FileWave Central Server and Assistants Menu Reference

FileWave Central groups administrative tools under the Server and Assistants menus. The available Assistants can vary by FileWave version and administrator permissions.

Server menu

Activation Code...

Opens the FileWave activation details used to license the environment.

Update Model...

Writes pending administrative changes to the FileWave Server database and creates the Model manifest sent to Clients. Update the Model after changing devices, Filesets, Deployments, or other settings that affect managed devices.

Revert to Last Model...

Returns the Server to the previous Model. This does not necessarily undo changes that devices have already completed, so review the affected Deployments and devices before reverting.

Get Logfile...

Retrieves a copy of the current FileWave Server process log for troubleshooting.

Open Logfile Folder

Opens the folder on the FileWave Central computer that contains Server logs retrieved with Get Logfile....
