

Filtering in Inventory Queries

What

Historically inventory queries in FileWave did not allow you to filter for specific values. In v14(+) you can now filter for text objects in very much the same way you can filter in the Clients view.

When/Why

We are going to want to filter whenever we need to get to data quickly. For instance, when a customer in the field calls with an issue and we ask them to give us the Asset Tag info for quick identification.

How

Filtering in any inventory query view is as simple as entering search text in the upper right filter field when the query is open. Note that filters in FileWave admin are "sticky" and will remain even when you leave the view and come back to it. See example below:
