

FileWave Server System Requirements

As of August 2024 v15.4.1, the below are supported for running FileWave Server, but for updated information, always consult the specific release on the [Downloads Page](#). The FileWave Server can also be installed on a Virtual Machine.

- macOS 12, 13 (Intel and Apple Silicon)
- Linux Debian 12.x x86_64

The minimum general guidance on CPU / RAM / Network / Storage is:

- CPU: For physical hardware use, at least the equivalent of an Intel Core i5 or Apple M1. For virtual hardware, use at least 2 virtual processors.
- RAM: Use a minimum of 8Gb of RAM with 16Gb recommended.
- Network: At least 1Gb network connection.
- Storage: 1Tb is a recommended minimum, but this will depend highly on OS updates and Filesets as well as if Windows Imaging is in use.

i Make sure you have enough space on your hard disk to store the cached Filesets for your FileWave Clients.
