

Legacy Web Clip App Portal for Older iOS and iPadOS Devices

What this workaround provides

An older iOS or iPadOS device that cannot install the current FileWave Kiosk app can open the legacy web App Portal through a Web Clip.

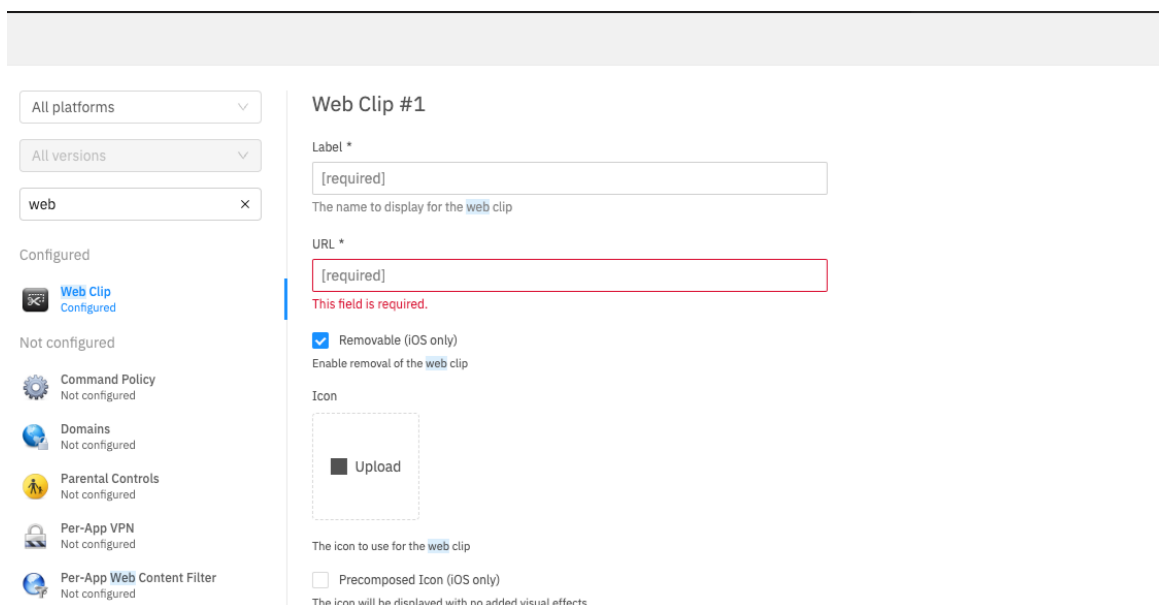

When to use it

Use this only as a temporary access path while an older device remains in service. The Web Clip does not make an unsupported operating system or device supported by FileWave.

Create the Web Clip

The Web Clip opens the legacy App Portal for the specific device by using its FileWave device ID in the URL.

1. Create a new Apple profile with a Web Clip payload in FileWave Central or FileWave Anywhere.

The screenshot shows the 'Web Clip #1' configuration page in FileWave. On the left, a sidebar lists various configuration options: 'All platforms' (dropdown), 'All versions' (dropdown), 'web' (selected), 'Configured' (Web Clip, Command Policy, Domains, Parental Controls, Per-App VPN, Per-App Web Content Filter), and 'Not configured' (Command Policy, Domains, Parental Controls, Per-App VPN, Per-App Web Content Filter). The main content area is titled 'Web Clip #1' and contains the following fields and options:

- Label ***: A text field with '[required]' placeholder. Below it, a note says 'The name to display for the web clip'.
- URL ***: A text field with '[required]' placeholder. Below it, a red error message says 'This field is required.'.
- Removable (iOS only)**: A checked checkbox with the label 'Enable removal of the web clip'.
- Icon**: A dashed box with an 'Upload' button. Below it, a note says 'The icon to use for the web clip'.
- Precomposed Icon (iOS only)**: An unchecked checkbox with the label 'The icon will be displayed with no added visual effects'.

2. Enter `https://fqdn:20443/ios/recommended_apps/%device_id%#apps` in the URL field, replacing `fqdn` with the FileWave Server's DNS name. Keep the `%device_id%` placeholder unchanged.
3. Deploy profile to desired device(s).
