

Finding packages in the WinGet Repository

What

WinGet is a command line tool to manage applications on the Windows platform.

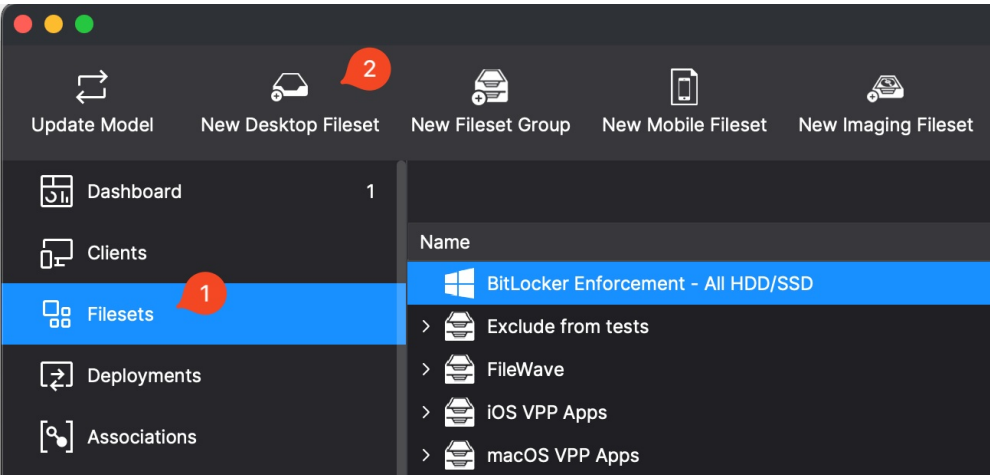

Note that FileWave 15.4 or later is required.

When/Why

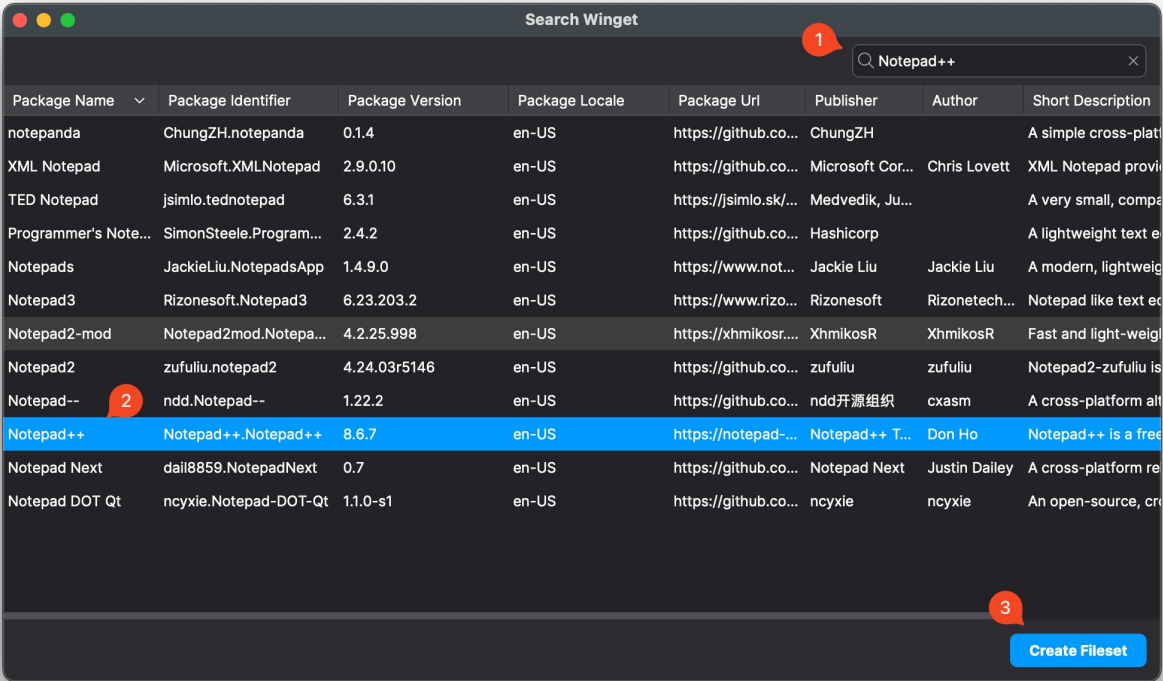

WinGet will install software. But, to do so, we'll need to see if the package we are looking for is in the repository.

How

In FileWave Central click on "New Desktop Fileset" when in the Filesets window and then pick "Winget" as the type of Fileset.

The results will show as below, and what we are most interested in is the unique identifier (Id):

In our case, since we want Notepad++ to deploy. Clicking Create Fileset will make it.
