

Parallels Desktop for Mac Business Edition Deployment (macOS)

Description

Creating a FileSet for Mass rollout of Parallels Desktop for Mac Business Edition Version 10

Ingredients

- FW Central
- Attached Script FileSet - [script - activate parallels desktop.fileset.zip](#)
- Resources available from [Parallels.com](#)

Directions

1. Follow the directions at <http://kb.parallels.com/en/120093> to create a pkg for mass deployment of parallels
2. Import the Parallels Desktop Autodeploy.pkg that you equipped with the Data in the first step into FileWave Admin
3. Import the attached file ([script - activate parallels desktop.fileset.zip](#)) , open it and edit the content of the script within. In the line `/usr/local/bin/prlsrvctl install-license -k XXXXXX-XXXXXX-XXXXXX-XXXXXX-XXXXXX` replace `XXXXXX-XXXXXX-XXXXXX-XXXXXX-XXXXXX` with your license key , save your changes and close the fileset.
4. Deploy both the PKG fileset and the script fileset to your test client. Make sure the PKG fileset has a higher priority than the script fileset - the attached script fileset is preset to lowest priority per default.
